- **Advanced Cellular Frame (ACF)**
- **Takeaways**

BIG PICTURE

EVOLUTION OF RDD

- 1964:** Cooper used local area directories to identify assigned prefixes and then appended a random four-digit suffix to create the seven-digit number for dialing.
- 1970:** Mitofsky developed a two-stage sampling scheme by relying on how numbers were assigned to increase the efficiency of the sample.
- 1978:** Waksberg introduced refinements by using PPS sampling for selection of the first-stage clusters of telephone banks.
- 1993:** Casady & Lepkowski introduced the method of list-assisted RDD by using telephone banks with at least one listed number.
- 1995:** Brick, Kulp, and Malarek quantified the ignorable undercoverage of list-assisted RDD.
- 2007:** Blumberg & Luke pointed out the coverage error of landline-only RDD that has led to the development of dual-frame RDD.

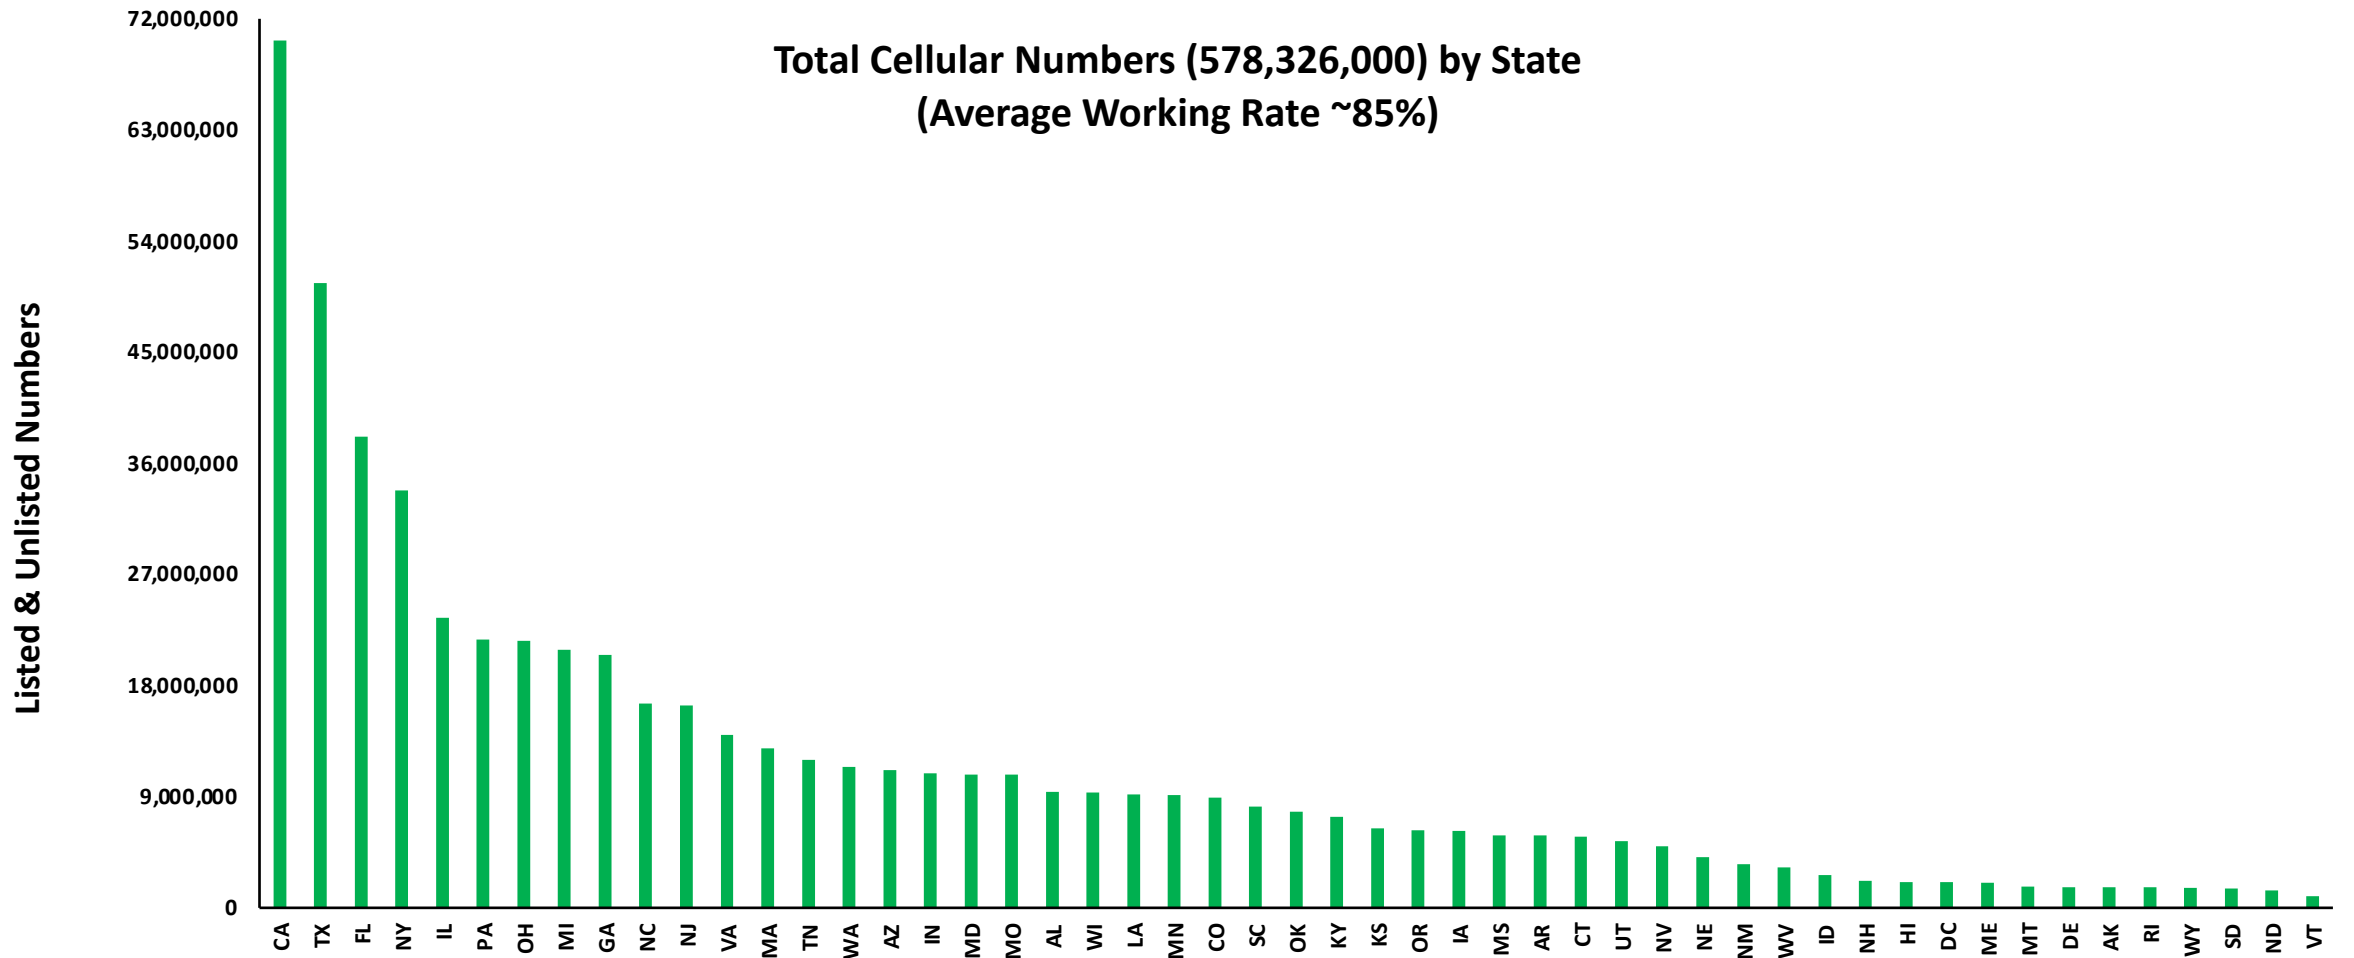

EVER-CHANGING DUAL-FRAME RDD

Percent Wireless-Only US Homes (NIH - CDC)

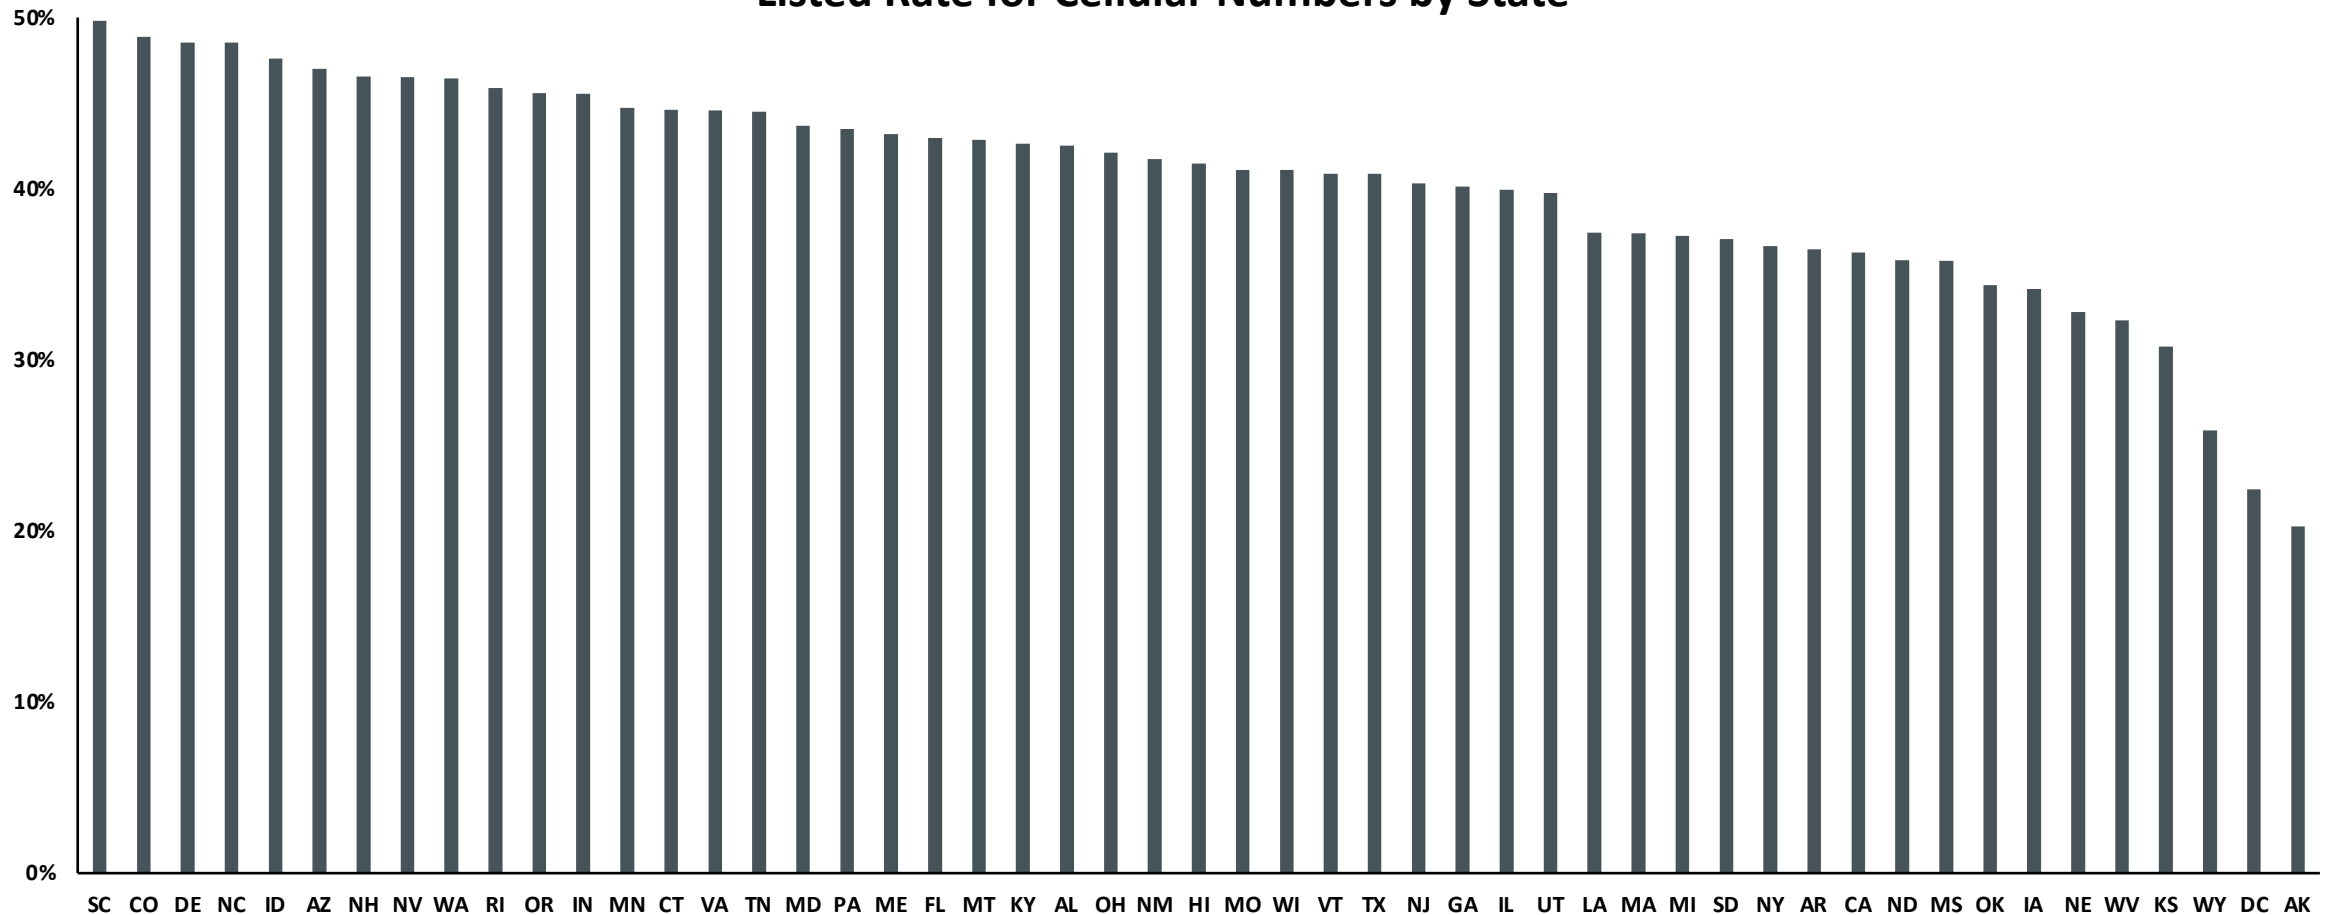

- Inconsistent mix of cellular and landline numbers in RDD samples
- Cumbersome methods of weighting to deal with frame multiplicity

TAKEAWAYS

➤ **Is RDD still a viable option?**

- Time and cost requirements are increasing
- Perhaps the only option for large rapid-response surveys

➤ **Coverage challenges of the legacy cellular frame:**

- Progressively undercovers smaller geographies (>50% for counties)
- A sizable screening cost for out-migrated numbers

➤ **Advanced Cellular Frame (ACF):**

- Improves coverage by including listed inwardly-migrated numbers
- Reduces cost by eliminating listed outwardly-migrated numbers
